1 IDAPALL, IDAP merged with demographic, income and educational data

DSECONAU Updated: Not a FSE data set.

ECONAU Updated: 07-02-2016. ECONAU data

1.1 Remarks on Update

In the previous version lead/lag of several data sets were wrong. Merge of grades on UDDA were wrong. IDAPALL is constructed from IDAP by merging variables from PERSONER, IDAN, UDDA, RAS, INDH, IEPE. NOVPRIO is a sequence number for number of jobs in CON. It starts in 1990. It has been set to 1 for 1980-1989. FORSKAT_RAS has been renamed to FORSKAT. AKASSE_RAS has been renamed to AKASSE. SEKTOR has been added: 1 Public, 2 Private, 0 Others. From IDAN all records with TYPE in (H,A,S,M) are merged to IDAPALL. 70 observations are present in one of the other data sets, but not in IDAP. 54 observations are in IDAP but not in IEPE. Working on documentation.

1.2 Description

IDAPALL consists of all persons with a primary employment. It contains demographic, educational and socio-economic variables from many data sets.

Data Break 2008 There is a major data break in 2008 as new data sources are introduced.

- In 1980 to 2007 *CON* is major source of employee earnings. It is a yearly report from employer. The employment spell is specified as entire year, a specified sub-period, a number of unspecified employments. From 2008 the source is *BFL*, which is a monthly report with start-date and end-date of the employment. It looks like 1980 to 2007 contains too many all-year employment. The result is a drop in number of jobs in 2008.
- In 1980 to 2007 the source of non-employee earnings are several data sets. From 2008 these data sources have been combined in *OF* and data from the different data sets have been cross-validated and overlapping spells have been removed.
- A person is in the labour force, but unemployed, if the person is full time unemployed in the End-of-November week.
- In 1980 to 2007 a person was defined as an employee if the total, yearly salary exceed app. 10.000 DKR. After 2008 a person is defined as an employee if the salary exceeds 4 hours of regular low-paid employment. To be employed end of november either the job spell must include this period or the ATP-payments are equal to the contributions of a yearly, full-time employment.
- In summary the changes result in fewer employee jobs. The largest decline is for the group of age 18-29. For the group below 18 there is an increase because their yearly salary is below 10.000 DKR.
- The definition of yearly income was changed in 2013.
 - The income of self-employed was changed in 2013. Interest and capital payments related to the firm are included in the income of self-employed. The change change the number of persons grouped as employee, self-employed and out-of-labour force. App. 15.000 persons were moved from self-employed to early retirement (efterløn)
 - The imputed income from owning ones residence is reduced to the macro value used in national accounts . Before the change it was 4of the residence.
 - Danish national church tax is no longer part of the income/tax figures
 - Employer paid sickness payments are moved from public transfers to earnings
 - Green compensation payment is included as income from 2010
 - Transfer payments are split into private pensions and public transfer payments
- Change in *SOCIO* in 2013. Persons, age above 15 years, with a salary below 0.000 DKR and less than 950 hours of work are classified as "Persons above 15 years in education". App 115.000 persons have been moved to this group for employee.

- The 2013 income and socie variables have been extended back to 1987, income of self-employed has a break in 1994, because HONNY does not exist before 1994.
- *CON* and *BFL* are available in January in the year following the year of the income. Income of self-employed is not available until the final tax-income register in November. For a number of self-employed persons data is not available until later than November. In such cases they may be groupd as employee, hence we observe a number of wrong sequences: self-employed, employee, self-employed.

The new DS datasets have changed many variable names and included many new variables. The following table shows the relationship between ECONAU variable names and the FSE variable names in the source dataset.
